CoAP Protocol Negotiation

draft-silverajan-core-coap-protocol-negotiation

Bill Silverajan TUT

Mert Ocak Ericsson

Summary of changes

- Until -03
 - Used .well-known/core to expose CoAP origin server's available alternative transports
- From -04
 - Using .well-known/core was discontinued owing to concerns about CoRE Link format violations
 - Usage of CoRE Resource Directory was proposed, with two new optional RD parameters
 - But WG also asked to explore non-RD scenarios

In -06

- Several ways of achieving that were considered
- Introducing a new CoAP Option was the optimal choice to allow clients to discover alternative transports on origin servers

Proposal in -06: CoAP Option "Alternative-Transports"

C=Critical, U=Unsafe, N=No-Cache-Key, R=Repeatable

- Used bidirectionally between client and origin server
- Flexible means to discover multiple transports
- Functional equivalence to using an RD for transport discovery

RD Registration and Lookups

Registration Request from origin server to RD

```
POST coap:/rd.example.org/rd?ep=node1
&at=coap+tcp://server.example.org/,coaps+tcp://
server.example.org/,coap+ws://server.example.org/
```

Lookup Request from client to RD

Alternative-Transport CoAP Option

```
Client
                                         Server
      GET /temperature
      Token: 0x64
      Alternative-Transport: tcp
        2.05 Content
        Token: 0x64
        Payload: 21.0 Cel
        Alternative-Transport:
          coap+tcp://server.example.org/
        Alternative-Transport:
          coaps+tcp://server.example.org/
```

Alternative-Transport CoAP Option

```
Client
                                         Server
      GET /temperature
      Token: 0x64
      Alternative-Transport: tcp
      Alternative-Transport: sms
        2.05 Content
        Token: 0x64
        Payload: 21.0 Cel
        Alternative-Transport:
          coap+sms://0015105550101/
        Alternative-Transport:
          coap+tcp://server.example.org/
        Alternative-Transport:
          coaps+tcp://server.example.org/
```

Alternative-Transport CoAP Option

```
Client
                                             Server
      GET /temperature
      Token: 0x64
      Alternative-Transport: (null)
         2.05 Content
         Token: 0x64
         Payload: 21.0 Cel
        Alternative-Transport:
           coap+sms://0015105550101/
        Alternative-Transport:
           coap+tcp://server.example.org/
         Alternative-Transport:
           coaps+tcp://server.example.org/
         Alternative-Transport:
           coaps+ws://server.example.org/
           IETF 99 draft-silverajan-core-coap-transport-negotiation
```

Forthcoming work

- Clients and servers to potentially exchange and agree upon an alternative transport
- Keep in mind (related) effort in
 - SWORN (for securely enabling transports for T1 nodes),
 - CoAP Signalling messages (to exchange capabilities)
 - RFC 7301, RFC 7838
 - Others?
